Escherichia coli beta-lactamase (AAW16634), including the signal peptide,

Page

28;

38pp; English

is the expression product of a molecular chimaera, designated (AAT66737), in which the beta-lactamase gene is under control intermediate/early promoter. Vectors consisting of a transcri

under control of the CMV of a transcriptional

i pCMV-BL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              enzyme prodrug therapy. Expression of the beta-lactamase gene can be used for cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or inflammation.

Secretion of the enzyme has the advantage of increasing neighbouring cel kill
                                 The intracellular form (AAM18680) of TEM beta-lactamase is expressed pCMV-delBL (AAM70311) in which a PCR-amplified beta-lactamase coding sequence, minus the signal sequence, is placed under control of the intermediate/early promoter of cytomegalovirus. The expression constructs pRNH127 and pRNH155 contain identical sequences but were constructed using different strategies (see AAQ36498). The constructs comprise exons 2-7 of human CYP1A1 gene under the control of the inducible mouse metallothionein (MMT-1) promoter. The constructs also contain an open reading frame in the opposite orientation to the cytochrome P450 exons. This ORF encodes ampicillin resistance. The constructs are suitable for transformation of human fibroblasts derived from the xeroderma pigmentosum group A. Cultures of the transformed fibroblasts can be used to test substances for mutagenicity. The presence

A secretory beta-lactamase (AAR97619) is expressed from DNA construct pCMV-BI (AAT99220), in which the beta-lactamase coding sequence is under the control of the intermediate/early cytomegalovirus promoter. Beta-lactamase delivery to mammalian cells confers sensitivity to cephalosporin prodrugs. Liposomal DNA/5-fluorouracil prodrug combinations resulted in s.c. tumour regression in mice bearing A549 tumours. Survival of mice bearing human large cell lung H460 intrathoracic (i.t.) tumours was increased upon i.t. injection of the secretory beta-lactamase DNA
                                                                                                                                                      Molecular chimaera for use in enzyme gene therapy - is activated in target cell to express a secretable enzyme which cleaves a prodrug outside the cell into a cytotoxic or cytostatic agent.

cytochrome P450IA1 (CYPIA1) expression construct. Two clones, pRNH127 and pRNH15, were isolated by different methods and which both had the same sequence. The CYPIA1 construct is used in assays to test for cytotoxicity of humans to a chemical. The method comprises exposing human fibroblast cells normally not including any cytochrome P450 activity to potentially coxic chemicals. The cells having been transformed to express cytochrome P450, under the control of a controllable promoter through the CYPIA1 gene, upon exposure to the chemical in vitro. The chemical is metabolised intracellularly into a cytochrome metabolite by oxidation within the
                                                                                                                                                                                                                                The present sequence is encoded by a chimeric mouse metallothionein-cytochrome P450IA1 (CYP1A1) expression construct. Two clones, pRNH12
                                                                                                                                                                                                                                                                                                                                                                 Testing chemicals for cytotoxicity to human by detecting gene damage using recombinant fibroblasts transformed with cytochrome P450 gene control of inducible promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hines RN,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
             Escherichia coli beta-lactamase (AAM16635), lacking the signal peptide, is the expression product of a molecular chimaera, designated pCMV-delBL (AAT66738), in which the beta-lactamase gene is under control of the CMV intermediate/early promoter. Vectors consisting of a transcriptional regulatory DNA sequence linked to a beta-lactamase gene can be used for enzyme prodrug therapy. Intracellular expression of the beta-lactamase in a targetted cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   fibroblasts through the intracellular cytochrome P450 mixed function oxidase enyzmes expressed by the cells. Gene damage in the test cells detected as an indication of cytotoxicity of the chemical. (Updated -MAR-2003 to correct PF field.)

This invention describes a novel tetracycline assay that uses recombinant prokaryotic cells comprising a luciferase gene under the transcriptional control of a tetracycline repressor and tetracycline promoter and involves the detection of luminescence emitted form the cells. The assay can be used to distinguish tetracycline form other microbial agents. The invention also describes a novel plasmid comprising either the luxCDABE genes, a tetracycline repressor (TetR) and comprising either the luxCDABE from Tn10, or the insect luciferase gene, a tetracycline repressor (tetR) and a tetracycline promoter (TetA) from Tn10. The tetracycline assay method can be used for the determination of tetracycline in a sample,

The method can also be used to determine the presence or concentration of antibiotics in foodstuffs, e.g. for allergic people. The present assay method does not rely on the growth of microbes as do conventional tests, and so is much more rapid. The present assay is also more sensitive, as even a small amount of luminescence can be detected

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           60
```

This invention describes a novel method for the selection of monoclonal antibodies (MAb) which comprises (i) fusing B lymphocytes with myeloma cells to produce antibody-producing hybridomas such that the antibodies are presented at the surface of the hybridomas by an antibody-binding protein (I); and (ii) binding the antibody to antigens (Ag). The

The method is used to select MAb with specificity for particular antigens. MAb can be selected without separate culture of hybridomas, and selection can be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex mixtures of hybridomas can be used for selection, reducing the time and cost involved in MAb selection. This sequence represents the bla protein protein contained in the expression vector pSEXISG2 which contains the bla protein for selection, Neo-R and protein G described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 286 AA;
                                                                                                                   antibody library.
                                                                                                                                                     Selecting monoclonal antibodies, by expressing them on the surface of hybridomas attached to antibody-binding protein, then reaction with
                                                                                                                                                                                                                                                                         N-PSDB; AAA71428.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC This invention describes a novel method for the selection of monoclonal CC antibodies (MAb) which comprises (i) fusing B lymphocytes with myeloma CC cells to produce antibody-producing hybridomas such that the antibodies CC are presented at the surface of the hybridomas by an antibody-binding CC protein (I); and (ii) binding the antibody to antigens (Ag). The CC invention also describes antibody-binding proteins (I) that comprise a CC combination of the signal peptide of a murine immunoglobulin (Ig) kappa CC chain or a murine MHC (major histocompatibility complex) Class I k(k) CC molecule; an antibody-binding site of proteins A, G, L or LG, and the CC transmembrane domain of PDGFR (platelet-derived growth factor receptor) CC or CD52. The method is used to select MAb with specificity for particular antigens. MAb can be selected without separate culture of hybridomas, and CC election can be made against many antigens in a library, optionally on CC the basis of strength of affinity for a particular antigen. Complex CC mixtures of hybridomas can be used for selection, reducing the time and CC cost involved in MAb selection. This sequence represents the Neo-R CC protein contained in the expression vector pSEXIII4 which contains the CC bla protein, Neo-R and protein G described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC This invention describes a novel method for the selection of monoclonal CC antibodies (MAb) which comprises (i) fusing B Jymphocytes with myeloma CC cells to produce antibody-producing hybridomas such that the antibodies CC are presented at the surface of the hybridomas by an antibody-binding CC protein (I); and (ii) binding the antibody antipody binding proteins (Ag). The CC invention also describes antibody-binding proteins (I) that comprise a CC combination of the signal peptide of a murine immunoglobulin (Ig) kappa CC chain or a murine MHC (major histocompatibility complex) Class I k(k) CC molecule; an antibody-binding site of proteins A, G, L or LG, and the CC transmembrane domain of PDGFR (plattelet-derived growth factor receptor) CC or CD52. The method is used to select MAb with specificity for particular CC contigens. MAb can be selected without separate culture of hybridomas, and CC the basis of strength of affinity for a particular antigen. Complex CC mixtures of hybridomas can be used for selection, reducing the time and CC cost involved in MAb selection. This sequence represents the bla protein CC bla protein, Neo-R and protein G described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches 181; Conservative

The host cell also contains a second heterologous polymucleotide encoding a secretory polypeptide to facilitate the secretion of the expressed polysaccharase. The recombinant host cell is useful for producing polysaccharase which is useful for enzymatically degrading oligosaccharides such as lignocellulose, hemicellulose, cellulose, pectin or their combinations, and fermenting the product to ethanol, by simultaneous saccharification and fermentation processes. The present sequence is encoded by an integration vector which was introduced into cells to generate recombinant host cells. The vector contains a surrogate promoter from Zymomonas mobilis, the celZ gene from Erwinia chrysanthemi, resistance markers bla and tet, and Klebsiella oxytoca
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 286 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant host cells useful for producing polysaccharase for degrading oligosaccharides, comprises a first heterologous polynucleotide encoding polysaccharase under control of surrogate promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 82-83; 87pp; English.

Bla protein - Salmonella typhimurium plasmid NTP16
NyAlternate names: beta lactamase homolog
CySpecies: Salmonella typhimurium
CyDate: 30-Sep-1993 #sequence_revision 30-Sep-1993
CyAccession: JQ1546
R;Cannon, P.M.; Strike, P.
Plasmid 27, 220-230, 1992
